Abstract of JP7067094

PURPOSE: To inexpensively and freely attain the setting of the chargeable channel/free channel of each channel, and the subtraction rate of each chargeable channel.

CONSTITUTION: For example, the data on the chargeable channel/free channel and the subtraction rate of each chargeable channel are set in a RAM-54 by using a private remote control device or a prepaid card. Then, a control signal is applied from a remote control device 20 to a prepaid card device 16. In the prepaid card device 16, whether the channel is the chargeable channel or the free channel is judged by each channel based on the control signal and the data stored in the RAM54. When the channel is the chargeable channel, the use frequencies of a prepaid card 40 is subtracted by the subtraction rate of each channel, and a TV main body 12 is controlled according to the residual use frequencies. When the channel is the free channel, the control signal from the remote control device 20 is repeated to the TV main body 12 regardless of the residual use frequencies.
